**MBX™ FILL**

**ENERGY SAVINGS**
Clogged fill increases cold water temperature, thus increasing demand on a chiller. For example, one degree warmer water can increase chiller energy consumption by 2%.

**LOWER INSTALLATION COST**
Utilizing Marley Bottom Supported ("MBX") fills can yield 30-40% labor savings compared to replacement with fill sheets.

**DRIFT**
With Marley OEM fill replacement, we guarantee drift levels will match original tower drift performance, reducing impact on neighboring properties.

**EASE OF MAINTENANCE**
Removable fill packs allow for easy cleaning to prolong fill life.

**PRODUCT DESIGN KNOWLEDGE**
The PVC formulation used by Marley fill has been specially formulated, tested, and proven to prevent degradation in the harsh conditions of cooling towers*. For example, strong acrylic impact modifiers are used to prevent damage from UV light.

**INNOVATION**
We have 23 fill patents, showing our knowledge and dedication of resources to continuously improve our fill products.
# MBX™ FILL

## THE COMPARISON

<table>
<thead>
<tr>
<th>MARLEY® MBX</th>
<th>BRENTWOOD® XF75</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>THERMAL PERFORMANCE</strong></td>
<td><strong>ENERGY SAVINGS</strong></td>
</tr>
<tr>
<td>Marley MBX fill delivers 9% greater thermal performance compared to Brentwood XF75 fill*</td>
<td>Brentwood XF75 fill can reduce thermal performance by increasing cold water temperature up to 9% compared to Marley MBX fill*</td>
</tr>
<tr>
<td>The greater thermal performance of Marley MBX fill translates directly into lower energy consumption by the chiller in HVAC applications</td>
<td>Brentwood XF75 fill can result in up to a $2,628 increase in annual energy costs compared to Marley MBX fill due to increased load on the chiller motor***</td>
</tr>
<tr>
<td>Guaranteed drift levels matching original tower performance, reducing impact on neighboring properties, and prolonging life of the mechanical equipment</td>
<td>Brentwood XF75 fill exhibited a higher number of drift particles and larger drift particle size**</td>
</tr>
<tr>
<td>The fill sheets within a Marley MBX fill pack have a standard thickness of 15 mil after forming</td>
<td>Brentwood XF75 fill has options for 8, 10 or 15 mil after forming, so be sure that you understand what they are quoting to get a true cost comparison</td>
</tr>

</table>

## REFERENCE:

* Based on test results measuring the approach temperature at the SPX CT Development Center.
  Model NC8306K operating at 50hp and 1746 gallons per minute. HW/CW/WB conditions of 95/85/78 degrees F.

** Based on Drift Particle size sampling at the SPX CT Development Center.

*** The 17% reduction in thermal performance yields approximately 1 degree F higher temperature exiting the cooling tower (assuming 95/85/78 degrees F conditions). This can affect the chiller by 2% in lost energy performance due to increased load on the chiller motor. The extra load is required to reject sufficient heat to maintain the same target air temperature. The resulting energy cost increase can be calculated as follows:
  Chiller motor = 400hp  
  Lost chiller performance = 2%  
  400hp X 2% = 8hp = 6 kilowatts  
  6 kilowatts X 8,760 hours per year = 52,560 kW per year  
  Use average price of electricity in your region to calculate cost per year  
  http://www.eia.gov/electricity/monthly/epm_table_grapher.cfm?t=epmt_5_6_b  
  Assuming cost of $0.10 per kW hour:  
  Cost = 52,560 X 0.10 = $5,256 annual cost for energy loss of 1 degree F cooling water temperature
